Avery McKie

averymckie@gmail.com

Summary

Engagement and service-continuity lead with experience translating regulated-data governance into operational controls, building portfolio-level executive reporting across SLA, incident, and readiness signals, and tracing production incidents to permanent root cause. Recent work spans electric-utility OT-to-IT trust boundaries (NERC-CIP) and healthcare-payer requirements translation (HIPAA), with consistent patterns of cross-functional facilitation, decision-artifact production, and methodology sign-off ahead of downstream distribution.

Cover Note

Hiring team at Talent Software Services, Inc —

I am writing to apply for the Senior Manager, Clinical Trials role. My recent work has been adjacent to clinical-trial operations rather than directly in them. At Southern California Edison I led service-continuity engagements that translated regulated-data governance into operational controls, with sign-off authority over the documentation backing each readiness gate. I also created portfolio-level executive reporting that connected SLA adherence, incident trends, and go/no-go readiness into a consolidated operational view, reconciling delivery-team data with cost and schedule baselines held separately by finance. At American Express I traced production incidents to permanent root cause and established the configuration-gap patterns that prevented recurrence.

The shape of the work transfers — requirements rigor under regulatory constraint, cross-functional stakeholder facilitation, evidence-based gate decisions — even though the specific regulatory regimes I have operated under are different from yours. Happy to walk through the bridge on a call.

Selected Experience

Southern California Edison — Service Continuity / Engagement Lead

- Facilitated process ownership assignment for 12 support processes across six cross-functional groups, resolving whether substation equipment required different ownership models than data center infrastructure and defining procedure applicability, responsibilities, and notification thresholds by role and event category.
- Specified security requirements for a data pipeline crossing an OT-to-enterprise boundary, covering unidirectional flow, authentication, audit logging, and latency commitments derived from the trust boundary constraints, not application requirements alone.

- Defined operational readiness requirements for a compliance-driven ingestion pipeline moving data from a NERC-regulated environment to an enterprise data store, covering asset classification, credential lifecycle governance, encrypted transfer, and dual-access authorization methods traceable to specific regulatory and operational constraints.
- Created portfolio-level executive reporting by connecting SLA adherence, incident trends, and go/no-go readiness into a consolidated operational view where none had existed, reconciling delivery team data with cost and schedule baselines held separately by finance to produce decision artifacts for each gate.
- Developed readiness reporting standards for go/no-go decisions that reconciled readiness data distributed across delivery teams with cost and schedule baselines held by finance, expressing risk in business terms to give each gate a decision artifact carrying both operational and financial evidence.
- Diagnosed root cause for production and deployment failures across concurrent programs by correlating monitoring data from DX Spectrum, environment configurations, and change records in Jira, reducing repeat failures by tracing each incident to its permanent origin.
- Oversaw data quality governance with monthly cost attribution freshness checks across active services in PowerBI and quarterly comparisons of budget distribution against operational performance by strategic priority area, requiring action owner documentation before each governance cycle closed.
- Managed data validation for the intelligence platform, running monthly field completion audits across all connected practices in PowerBI, SLA breach attribution completeness checks in BMC Remedy, and quarterly calibration confirming that rising workaround load still preceded rising incident reopen rates.

Aetna — Business Analyst

- Defined measurable acceptance criteria for healthcare system changes across clinical, operational, and compliance stakeholders, establishing explicit tolerance thresholds and documenting pass/fail determinations to give each sign-off a defensible, auditable basis.
- Facilitated requirements workshops in collaboration with clinical, operational, and compliance stakeholders; documented conflicts before session close; confirmed shared definitions for each stakeholder group; and verified development team handoff for each sprint commitment, preventing unresolved conflicts from entering the build.
- Specified data integration requirements for analytic datasets drawing from medical, pharmacy, lab, and utilization records to evaluate program effectiveness; documented join logic for each source combination and data quality rules for each field; and obtained derivation methodology sign-off to prevent flawed outputs from reaching distribution.

American Express — Business Analyst / Solution Designer

- Traced recurring production incidents to permanent root cause through behavioral analysis of logs and process records, documenting failure patterns, identifying configuration gaps for each failure class, and verifying corrections against historical recurrence data to confirm the fix held.

Architecture Documentation Tracker

Documentation artifacts implied by this role causal datapoints, mapped to recognized architectural standards.

Datapoint	Standard	Artifact	Source
Architecture description	**ISO/IEC/IEEE 42010:2022**	Architecture viewpoint declaration with stakeholder concerns	https://standards.ieee.org/ieee/42010/6846/ (accessed 2026-04-29)

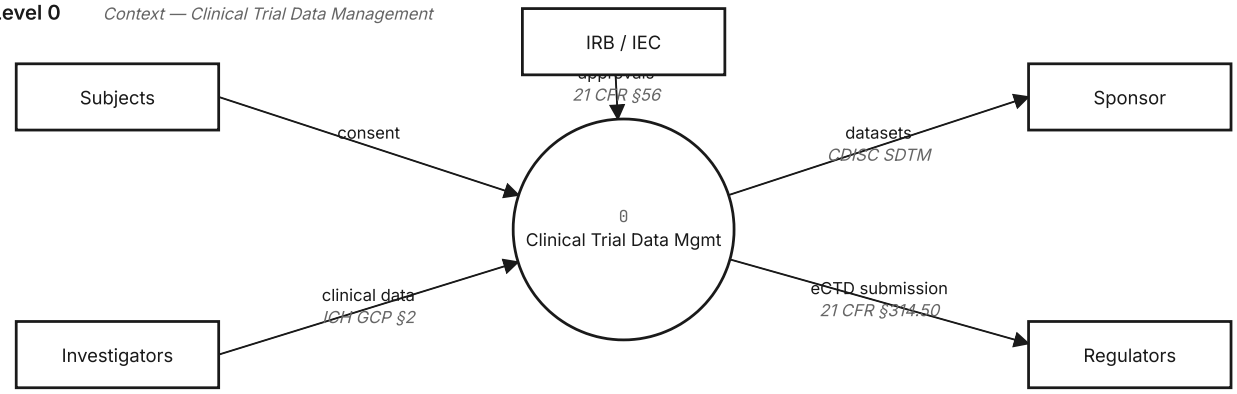
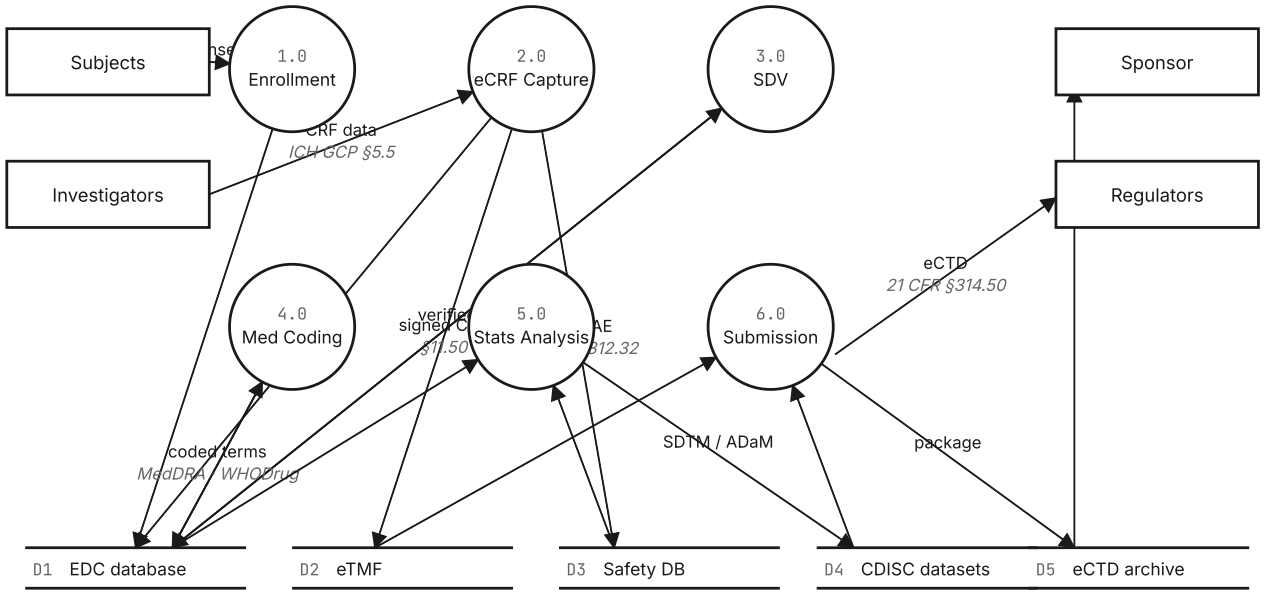
Operations View - Clinical-trial data architecture

Multi-level data-flow decomposition (Yourdon-DeMarco L0 → L1 → L2). C4 system context is too sparse for this view; the spec selects multi-level DFD for architecture-shaped renders.

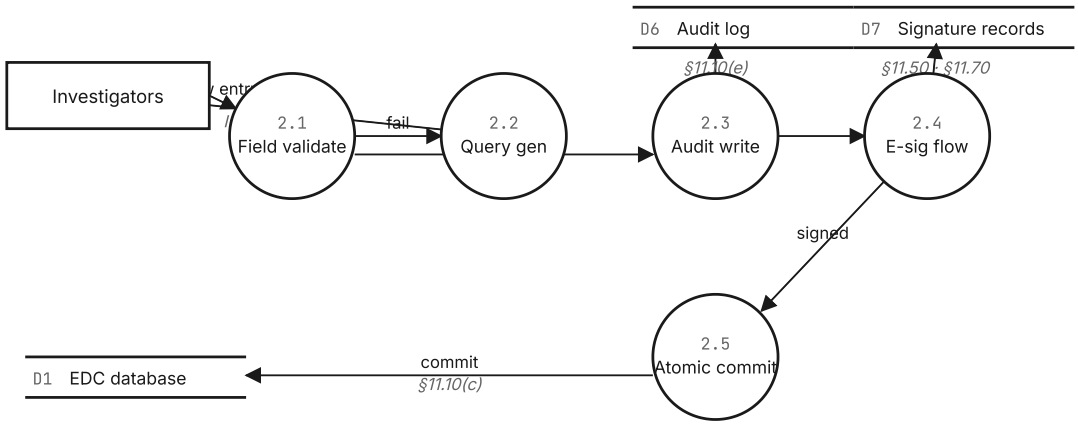
Level 0 *Context — Clinical Trial Data Management*



Level 1 *Major processes + stores*



Level 2 *Decomposition of 2.0 eCRF Capture (electronic-records lifecycle)*



Workflow and Activity Coverage

Catalog elements this role evidences engagement with, derived from per-bullet classification against the 364-activity ITIL 4 catalog and the 138-workflow industry profile inventory.
